Traditionally, Lorentzian geometry has been used as a necessary tool to understand general relativity, as well as to explore new genuine geometric behaviors, far from classical Riemannian techniques. Recent progress has attracted a renewed interest in this theory for many researchers: long-standing global open problems have been solved, outstanding Lorentzian spaces and groups have been classified, new applications to mathematical relativity and high energy physics have been found, and further connections with other geometries have been developed.

Samples of these fresh trends are presented in this volume, based on contributions from the VI International Meeting on Lorentzian Geometry, held at the University of Granada, Spain, in September, 2011. Topics such as geodesics, maximal, trapped and constant mean curvature submanifolds, classifications of manifolds with relevant symmetries, relations between Lorentzian and Finslerian geometries, and applications to mathematical physics are included. ?

This book will be suitable for a broad audience of differential geometers, mathematical physicists and relativists, and researchers in the field.

Carl Strum:

In this 21st millennium, people become competitive in every single way. By being competitive right now, people have do something to make all of them survives, being in the middle of the particular crowded place and notice through surrounding. One thing that at times many people have underestimated it for a while is reading. That's why, by reading a book your ability to survive boost then having chance to stay than other is high. For yourself who want to start reading some sort of book, we give you this kind of Recent Trends in Lorentzian Geometry: 26 (Springer Proceedings in Mathematics & Statistics) book as starter and daily reading guide. Why, because this book is more than just a book.
